

# Aggregating bibliographic records for resource discovery

Gordon Dunsire

RIN Expert Seminar on union catalogues for the UK,  
London, 30 Jan 2007

# Key issues (recast)

- Source metadata varies in structure and content, both subject to significant change
- Aggregation involves permanent/temporary mappings which must change if the source changes
- Every aggregation has a specific focus which may not be UK/Research/Library/Resource discovery
- Dublin Core was developed as a tool for metadata aggregation in heterogeneous information environments
